

The Comfy Skies of Corrigan

Douglas Corrigan, the new president of Trans-Atlantic Airlines, believes the seats on their Boeing 757's are not as comfortable as they might be. The trans-Atlantic flights are relatively long, and passenger comfort is of greater concern than on domestic flights from, say, Long Beach to New York.

The current arrangement of seats, diagrammed below, offers different amounts of passenger space depending on whether the passenger is in First, Business, or Economy class. Previous surveys of passenger appreciation have indicated window seats are more preferred than aisle seats. There appears to be no preference for left- or right-hand sides of the plane.

The more comfortable seats that Trans-Atlantic is considering using are somewhat more expensive, and they want solid evidence of greater passenger comfort before installing them on all the planes in their fleet. Though the seats are different in appearance in the different passenger classes, the new seats are indistinguishable in appearance from the current seats.

Your task is to design an experiment to assess whether there is a difference between the passenger comfort between the old and new seats. You may determine where to place the new seats as you wish over the plane, and they can be bolted in as individual seats.
